

Argano Master Data Centralization

Manage critical master data across your enterprises

Master data management is more than a principle or theoretical process. With Argano's Master Data Centralization (MDC), it becomes an everyday practice.

MDC extends your Microsoft Dynamics 365 Finance and Supply Chain solution and centralizes control and management of critical information through approval processes for new or updates to existing master data - essentially "de-siloing" management of all customer and vendor master data. It also has the ability to publish/release and subscribe to master data across your Microsoft Dynamics 365 companies, with the flexibility for local companies to set and manage authorized non-critical fields.

Fully embedded into a Microsoft Dynamics instance, MDC is used by global enterprises to improve the consistency, availability and manageability of their data across multiple locations, and streamline financial, purchasing, vendor and customer management capabilities.

Multiple business entities, one "source of truth"

Engineered to work seamlessly with Microsoft Dynamics (from legacy systems such as AX 2012 to Microsoft

Dynamics 365 Finance), MDC simplifies management tasks for businesses containing multiple entities. You can:

- centralize and control customer and vendor master data
- create customers/vendors locally while managing critical information centrally (e.g., payments, credit, purchasing, etc.)
- segregate Master Data Management from those who have other critical responsibilities
- support complex organization hierarchies, or data separation requirements by allowing for multiple centralized companies
- allow local organizations to review and accept centrally managed master data

In short, MDC allows the "arms and legs" of your business to operate independently, while keeping all critical data in the same brain.
