ERP Connect

Creating day-to-day operational excellence

By design, an ERP system has a role in just about everything.

- Supply chain management and optimization: from procurement to inventory control to planning to logistics.

- Finance: accounting principles, data unification, fraud prevention, audit trails, cash and bank management.

- Operations: streamlining workflows, process automation, reduction of manual labor, connecting departments and data.

But it's the rare organization that has its ERP system designed to coordinate all those needs optimally, in real-time, or in a way that lets them pivot when change is needed.

It's an equally rare organization that proactively aligns its ERP technologies and processes with market needs, cross-departmental team needs, and other critical business applications.

Which is why Argano designed ERP Connect, a collection of applications and services that empower clients with a systematic means of organizing/centralizing processes and data, increasing supply chain agility, and optimizing operations across all departments, functions, and locations.

Benefits:

- Implementation/support service to optimize ERP
- Improve supply chain management in just weeks
- Streamline and unify finance and operations
- Leverage the expertise of Microsoft's US Partner of the Year 2022 for Dynamics 365 Finance

ERP Connect Components

ERP Connect is not a single solution. It's a cohesive collection of implementation and support services and business applications built on Dynamics 365 Supply Chain Management, Dynamics 365 Finance, Azure, and other elements of the Microsoft Stack.

In addition to a strategy-specific implementation or optimization of Microsoft solutions, ERP Connect includes a wide range of IP and applications to extend the system, including:

Data Insights
A complete, preconfigured business intelligence and data warehouse solution with Power BI and Azure Analytics that turns data into actionable insights.

Workflow Manager
Enables teams to view, review, manage, and approve workflows in Dynamics 365 from anywhere, at any time via mobile devices.

Audit and Security Manager
Simplifies audit preparation and security management by offering a host of functionality and preconfigured data sets.

Master Data Centralization
Centralizes control and management of data from multiple companies, "de-siloing" the management of client, vendor, product and trade agreement data.

One Step Consolidation
Provides a single interface for entering all consolidation criteria with pre-set configurations.

AOT Browser
Allows Dynamics 365 users to browse the application object tree metadata through the web user interface.

Warranty Management
Seamlessly integrate comprehensive warranty management into Dynamics.

Electronic Batch Record
Digitize your batch record management, operation, review and reporting processes.

These unique applications are just the start.

ERP Connect includes a wide array of services–performance tuning, building Azure "digital twins," implementing control towers, warranty management, process automation, regression testing, and more– that help further tailor your ERP solution to address your immediate challenges and long-term goals.
